
机制示例（构造参数，非仿真数据）：$L_m = 2$ MB，$\omega_m = 2000$ cycles/byte，$\kappa = 10^{-27}$；$T^{cmp} = \omega_m L_m/(F_u/n)$，$E^{cmp} = \kappa\,\omega_m L_m\,(F_u/n)^2$。任务迁入使批内每任务时延上升、单任务计算能耗下降。
